Features
- High Gain: 21 dB
- Output P1dB: 20 dBm
- Variable Gain with Adjustable Bias
- Lead-Free 3 mm QFN Package
- Halogen-Free “Green” Mold Compound
- RoHS* Compliant

Description
The MAAM-010651 is a 3-stage, buffer amplifier with a 20 dBm output P1dB. The surface mount 3 mm QFN package allows easy assembly. This amplifier is fully matched to 50 ohms on both the input and output. It is designed for use as an LO buffer amplifier stage or as a driver amplifier in transmit chains and is ideally suited for 38 GHz band point-to-point radios.

Each device is 100% RF tested to ensure performance compliance. The part is fabricated using an efficient PHEMT process.

The MTTF is >1,000,000 hours at a 150°C junction temperature.

App Note [1] Biasing - It is recommended to bias the amplifier with $V_D = 4$ V and $I_{D,\text{TOTA}} = 250$ mA. It is also recommended to use active biasing to keep the currents constant as the RF power and temperature vary; this gives the most reproducible results. Depending on the supply voltage available and the power dissipation constraints, the bias circuit may be a single transistor or a low power operational amplifier, with a low value resistor in series with the drain supply used to sense the current. The gate of the pHEMT is controlled to maintain correct drain current and thus drain voltage. The typical gate voltage needed to do this is -0.3 V. Typically the gate is protected with Silicon diodes to limit the applied voltage. Also, make sure to sequence the applied voltage to ensure negative gate bias is available before applying the positive drain supply.

App Note [2] Bias Arrangement - Each DC pin ($V_D$ and $V_G$) needs to have DC bypass capacitance (100 pF/10 nF/1 µF) as close to the package as possible.
