

### Features

- High Voltage CMOS Technology
- Complementary Outputs
- Positive Voltage Control
- CMOS device using TTL input levels
- Low Power Dissipation
- Low Cost Plastic SOIC-8 Package
- 100% Matte Tin Plating over Copper
- Halogen-Free “Green” Mold Compound
- RoHS\* Compliant

### Description

The MADR-009269 is a single channel CMOS driver used to translate TTL control inputs into complementary gate control voltages for GaAs FET microwave switches and attenuators. High speed analog CMOS technology is utilized to achieve low power dissipation at moderate to high speeds, encompassing most microwave switching applications. The output HIGH level is optionally 0 to 2 V (relative to GND) to optimize the intermodulation products of FET control devices at low frequencies. For driving PIN diode circuits, the outputs are nominally switched between +5 V & -5 V.

## Handling Procedures

Please observe the following precautions to avoid damage:

## Static Sensitivity

These electronic devices are sensitive to electrostatic discharge (ESD) and can be damaged by static electricity. Proper ESD control techniques should be used when handling these devices.

Guaranteed Operating Ranges<sup>4,5,6</sup>

Symbol	Parameter	Unit	Min.	Typ.	Max.
$V_{CC}$	Positive DC Supply Voltage	V	4.5	5.0	5.5
$V_{EE}$	Negative DC Supply Voltage	V	-10.5	-5.0	-4.5
$V_{OPT}^{7,8}$	Optional DC Output Supply Voltage	V	0	—	$V_{CC}$
$V_{OPT} - V_{EE}$	Negative Supply Voltage Range	V	4.5	Note 7,8	16.0

$I_{OH}$	DC Output Current - High	mA	-50	—	—
$I_{OL}$	DC Output Current - Low	mA	—	—	50
$T_{RISE}, T_{FALL}$	Maximum Input Rise or Fall Time	ns	—	—	500

4. Unused logic inputs must be tied to either GND or  $V_{CC}$ .

5. MACOM recommends that  $V_{CC}$  be powered on before  $V_{EE}$ , and powered off after  $V_{EE}$ .

6. 0.01  $\mu$ F decoupling capacitors are required on the power supply lines.

7.  $V_{OPT}$  is grounded in most cases when FETs are driven. To improve the intermodulation performance and the 1 dB compression point of GaAs control devices at low frequencies,  $V_{OPT}$  can be increased to between 1 and 2 V. The nonlinear characteristics of the GaAs control devices will approximate performance at 500 MHz. It should be noted that the control current that is on the GaAs MMICs will increase when positive controls are applied.

8. When this driver is used to drive PIN diodes,  $V_{OPT}$  is often set to +5 V, with  $V_{EE}$  set to -5 V.

$T_{OPER}$	Operating Temperature	°C	-55	125
$T_{STG}$	Storage Temperature	°C	-65	150
ESD	ESD Sensitivity	kV	2.0	—

9. All voltages are referenced to GND. All inputs and outputs incorporate latch-up protection structures.

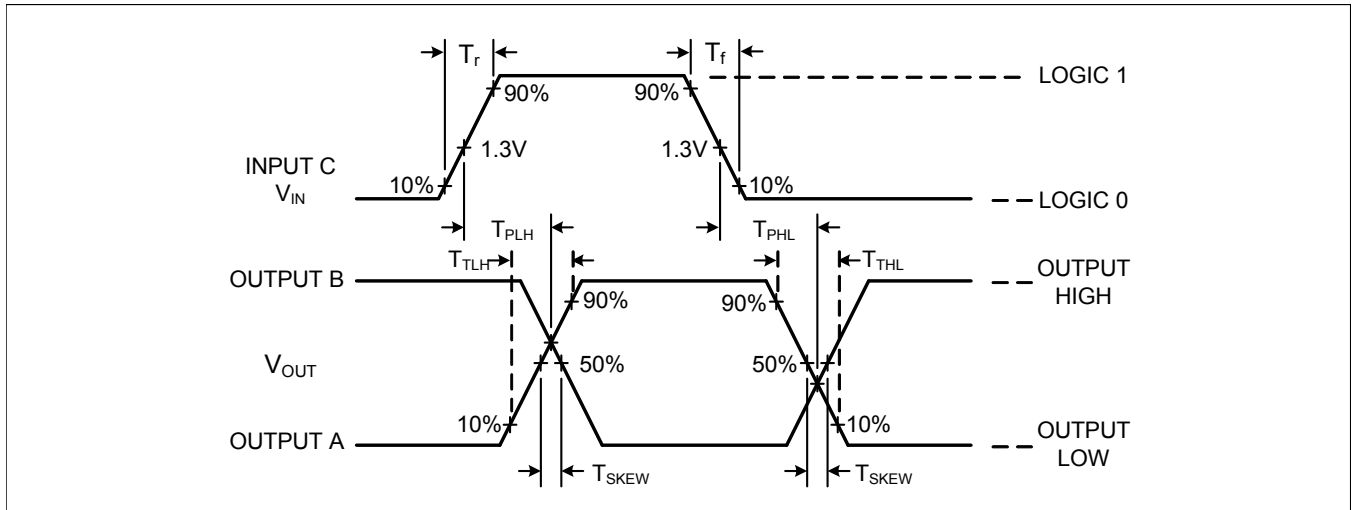

10. The maximum  $I_{EE}$  and  $I_{OPT}$  are specified under the condition of  $V_{CC} = 5.5\text{ V}$ ,  $V_{EE} = -5.5\text{ V}$ ,  $V_{OPT} = 5.5\text{ V}$ , and the total power dissipation is within 500 mW in still air.

11. The absolute maximum rating for  $V_{OPT}$  is  $V_{CC} + 0.5\text{ V}$ , or  $+7.0\text{ V}$ , whichever is less.

12. If  $V_{CC} \geq 6.5\text{ V}$ , then the minimum for  $V_{IN}$  is  $V_{CC} - 7.0\text{ V}$ .

13. Derate  $-7\text{ mW}/^\circ\text{C}$  from  $65^\circ\text{C}$  to  $85^\circ\text{C}$ .

### Switching Waveforms

### Equivalent Output Circuit for A and B Outputs (50 mA load at 25°C)

### Typical Application for a SPDT Switch

### Description of Circuit

The MADR-009269 provides a pair of complementary outputs that are each capable of driving a maximum of  $\pm 50$  mA into a load. In addition, with proper capacitor selection (C3 & C4) used in parallel with the current setting resistor (R1 & R2), additional spiking current can be achieved.

To achieve the non-inverting and inverting complementary voltages, each output is switched between two internal FETs. The FETs are connected to  $V_{OPT}$  for the positive output and  $V_{EE}$  for the negative output.  $V_{OPT}$  and  $V_{EE}$  are adjustable for various configurations and have the following limitations:  $V_{EE}$  can be no more negative than -10.5 volts;  $V_{OPT}$  can be no more positive than +5.5 volts and  $V_{OPT}$  must always be less than or equal to  $V_{CC}$ . Increasing  $V_{OPT}$  beyond  $V_{CC}$  will prevent the device from switching states when commanded to by the logic input. The most common configuration is to drive  $V_{EE}$  at -5.0 volts with  $V_{CC}$  and  $V_{OPT}$  tied together at +5.0 volts.
