Introduction

This Application Note is intended to provide practical guidance in the selection of PIN Diodes for switch control circuit functions. Switches, Digital and Analog Attenuators, and Limiters each have unique functions that require proper device selection. The design difficulty lies within the parametric translation from Diode Specifications, to the circuit designers’ Microwave Specifications. Diode parametric language such as Vb, Vf, Ct, Rs, τL, θ, must convert into Insertion Loss, VSWR, Isolation, P1dB, Input IP3, RF Operating Power, RF Power Dissipation, and D.C. Power Consumption Specification Terminology.

In addition to actual diode parameters, package parasitics play a significant role in determining switch circuit performance. Package capacitance, package inductance, package electrical resistance, and package thermal impedance are extremely important considerations to determine the effective frequency bandwidth and maximum incident power for reliable switch operation.

The manufacturing methodology dictates the type of diode selection. Surface mount assembly will mandate the usage of either plastic, HMIC SURMOUNT, or MELF & HiPAX ceramic devices. Chip and Wire (Hybrid) manufacturing will determine the usage of Cermachips, Flip Chips, or Beam Lead Devices. Schematics for the most common switch designs: Series-Exclusive, Shunt-Exclusive, and Series-Shunt are outlined below for consideration.

The Decision Making Process for PIN Diode Selection for Microwave Switch Design

The following procedure outlines and Effective Process for PIN Diode Selection for Switch Design.

1. Determine the Preferred Type of Manufacturing for the PIN Diode in the Switch Design: Surface Mount or Chip and Wire (Hybrid) Manufacturing.

2. Determine the Frequency of Operation and RF Power Handling of the Switch Design.

3. Use Table 1, “Relative Switch Performance and Design Evaluation Matrix” to determine the Type of Switch Design that Best Satisfies the Particular Switch Specifications and Requirements.

4. Use Table 2, “Relative PIN Diode Performance Evaluation Matrix” to Determine the Type of PIN Diode that Best Satisfies the Switch Design Selected from Table 1.

5. Use Table 3, “PIN Diode P/N Series Matrix” to Determine the PIN Diode P/N Series that Best Satisfies the Type of PIN Diode Selected from Table 2.
Table 1: Relative Switch Performance and Design Evaluation Matrix

</tr>
<tr>
<td>Overall Evaluation</td>
<td>34 Points</td>
<td>38 Points</td>
<td>40 Points</td>
</tr>
</tbody>
</table>

Notes:
1. Evaluation based upon following grading: Best = 5 Points, Moderate = 3 Points, Worst = 1 Point. The higher the score, the better the overall relative design advantage.
2. Where there is no significant relative advantage, a "Moderate" weighting can be used.

Assumptions for SP2T Design:
1. Design is a Reflective SP2T.
2. (2) Diodes are used per RF port.
3. Frequency Bandwidth is 3.0:1 maximum.

Conclusions:
The Series-Shunt Design is the Best in terms of Overall Switch Performance and value. Since each Design has a specific advantage, the decision for a Switch Design Selection is determined by the Specific Design Priorities for the requirement.

Conclusions:

1. **Plastic Devices** are best suited where **Cost** is a decision driver, the Operating Frequency < 4 GHz, and the RF C.W. Incident Power < 1 W (+ 30 dBm).
2. **MELF or HIPAX Ceramic Devices** are best utilized where **Highest Average Power** (> 20 W C.W.) is the Primary Design Goal and the Operating Frequency < 1 GHz.
3. **SURMOUNT Devices** are probably the **Best Overall Compromise** in Device Selection. They can Operate (In Various bands) from 10 MHz – 20 GHz and Perform well with RF Incident Power < 20 W C.W (+ 43 dBm).
4. **Cermachip Devices** provide the **Best Overall Performance** for Operating Frequency (100 MHz – 20 GHz), and RF Incident Power < 200 W C.W (+ 53 dBm).
5. **Flip Chip Devices** are best suited for **mmwave Frequencies** < 60 GHz, where the RF Incident C.W. < 1W (+ 30 dBm) and Conductive Epoxy or Soldering is Required.
6. **Beam Lead Devices** are best suited for **mmwave Frequencies** < 60 GHz, where the RF Incident C.W. < 0.1W (+ 20 dBm) and Thermo Compression Bonding is Required.
