Features

- No Wirebonds Required
- Rugged Silicon-Glass Construction
- Silicon Nitride Passivation
- Polymer Scratch and Impact Protection
- Low Parasitic Capacitance and Inductance
- Ultra Low Capacitance < 40 fF
- Excellent RC Product < 0.10 ps
- High Switching Cutoff Frequency > 110 GHz
- 110 Nanosecond Minority Carrier Lifetime
- Driven by Standard +5 V TTL PIN Diode Driver

Description

The MA4PBL027 is a silicon beam lead PIN diode fabricated with MACOM’s HMIC™ process. It features one silicon pedestal embedded in a low loss, low dispersion glass which supports the beam-leads. The diode is formed on the top of the pedestal, and air-bridges connect the diode to the beam-leads. The topside is fully encapsulated with silicon nitride and also has an additional polymer layer for scratch and impact protection. These protective coatings prevent damage to the diode junction and air-bridge during handling and assembly. The diodes exhibit low series resistance, low capacitance, and extremely fast switching speed.

Applications

The ultra low capacitance, low RC product and low profile of the MA4PBL027 makes it an ideal choice for use in microwave and millimeter wave switch designs, where low insertion loss and high isolation are required. The low bias levels of 10 mA in the low loss state and 0 V in the isolation state allows the use of a simple 5 V TTL gate driver. These diodes can be used as switching arrays on radar systems, high speed ECM circuits, optical switching networks, instrumentation, and other wideband multi-throw switch assemblies.

These electronic devices are sensitive to Ω — 3.0

Forward Current 100 mA

Series resistance (R_s) is equivalent to the total diode resistance: R_s = Junction Resistance (R_j) + Ohmic Resistance (R_c).

Handling Procedures

Please observe the following precautions to avoid damage:

Static Sensitivity

These electronic devices are sensitive to electrostatic discharge (ESD) and can be damaged by static electricity. Proper ESD control techniques should be used when handling these HBM class 1 devices.

General Handling

A polymer layer provides scratch protection for the diode junction area and anode air bridge. However, the leads of beam lead devices are very fragile and must be handled with extreme care. The leads can easily be distorted or broken by the normal pressures if not careful while handling with tweezers. A vacuum pencil with a #27 tip is the preferred choice for picking and placing.

Attachment

These devices were designed to be inserted onto hard or soft substrates. Recommended methods of attachment include thermo-compression bonding, parallel-gap welding and electrically conductive silver epoxy.

MACOM does not recommend sustained operation near these survivability limits.
