Features

- Low Noise Figure
- Excellent Input Return Loss
- Single Voltage Bias 3 V
- Integrated Active Bias Circuit
- Current Adjustable 20 - 80 mA with an External Resistor
- High Linearity, OIP3 >32 dBm
- Small Package: 2 mm PDFN-8LD
- RoHS* Compliant

Description

The MAAL-010705 is a high dynamic range single stage MMIC LNA with excellent linearity and low noise figure designed for operation from 0.5 to 1.6 GHz. The LNA is packaged in an RoHS compliant leadless 2 mm 8-lead PDFN package.

This MMIC has an integrated active bias circuit allowing direct connection to 3 V voltage supply and minimizing variation over temperature and process. The bias current and gain can be set with external resistors to allow the user to customize the current and gain value to fit the application.

The MAAL-010705 offers less than 0.7 dB noise figure, more than 32 dBm OIP3 and 20 dB input return loss. The excellent input match, low noise figure and high OIP3 along with the flexibility of setting current and gain make this LNA ideal for 3G and 4G cellular infrastructure applications.

For optimum performance above 1.6 GHz the MAAL-010706 is recommended. The MAAL-010705 and MAAL-010706 share the package type and footprint.

4. Exceeding any one or combination of these limits may cause permanent damage to this device.
5. MACOM does not recommend sustained operation near these survivability limits.
6. Typical thermal resistance ($\Theta_{jc}$) = 45°C/W.

Handling Procedures
Please observe the following precautions to avoid damage:

Static Sensitivity
Gallium Arsenide Integrated Circuits are sensitive to electrostatic discharge (ESD) and can be damaged by static electricity. Proper ESD control techniques should be used when handling these class 1A devices.

**Evaluation Board**

The above thru line can be provided to de-embed the losses of the evaluation board.

**Schematic**

$V_{BIAS}$ and $V_D$ are separate connections on the evaluation board to give the option of varying $I_D$ without changing $R_4$. They can be connected together to a single voltage supply during the measurement and in the final layout implementation of the PCB. If two different voltage supplies are used then apply $V_D$ first and then $V_{BIAS}$ to turn on the LNA. To turn off the LNA disconnect $V_{BIAS}$ first and then $V_D$. $R_3$ is varied to obtain different levels of gain. $R_4$ is varied to change the drain current $I_D$.

**Optional Schematic**

Optional schematic illustrates alternate grounding choice for $C_{13}$ through pin 5. Pin 5 is grounded internally in the package. Electrical performance of both layout methods is identical.
