Low Noise Amplifier
700 MHz - 6 GHz

Features
- Low Noise Figure:
  - 0.35 dB @ 1.9 GHz
  - 0.50 dB @ 2.6 GHz
- High Gain:
  - 22 dB @ 2.6 GHz
  - 15 dB @ 6.0 GHz
- High Linearity: 33 dBm OIP3
- Single Voltage Bias: 3 - 5 V
- Integrated Active Bias Circuit
- Current Adjustable 30 - 80 mA
- Lead-Free 2 mm 8-LD PDFN Package
- Halogen-Free “Green” Mold Compound
- RoHS* Compliant and 260°C Reflow Compatible

Description
The MAAL-011078 is a high dynamic range, single stage MMIC LNA with ultra low noise figure, high gain and excellent linearity. This amplifier is designed for operation from 700 MHz to 6 GHz and is housed in a lead-free 2 mm 8-lead PDFN plastic package.

This low noise amplifier has an integrated active bias circuit allowing direct connection to 3 V or 5 V bias and minimizing variations over temperature and process. The bias current is set by an external resistor, so the user can customize the power consumption to fit the application. \( V_{\text{BIAS}} \) can be utilized as an enable pin to power the device up and down during operation.

In the 50 \( \Omega \) environment and at 3 V, the MAAL-011078 offers 0.5 dB noise figure at 2.6 GHz, with 22 dB of gain and over 33 dBm output third order intercept point (OIP3). It is ideal for 5G & 4G cellular infrastructure and Wi-Fi applications.

</tr>
<tr>
<td>Operating Temperature</td>
<td>-40ºC to +85ºC</td>
</tr>
<tr>
<td>Junction Temperature</td>
<td>+150ºC</td>
</tr>
</tbody>
</table>

7. Exceeding any one or combination of these limits may cause permanent damage to this device.
8. MACOM does not recommend sustained operation near these survivability limits.
9. Operating at nominal conditions with $T_J \leq 150$ºC will ensure $MTTF > 1 \times 10^6$ hours.
10. Junction Temperature ($T_J$) = $T_C + \Theta_{JC} \times ((V \times I) - (P_{OUT} - P_{IN}))$

Static Sensitivity

Gallium Arsenide Integrated Circuits are sensitive to electrostatic discharge (ESD) and can be damaged by static electricity. Proper ESD control techniques should be used when handling these devices.
Biasing Options
The MAAL-011078 bias can be set in 2 different ways: using only V\textsubscript{DD} or using separate V\textsubscript{DD} and V\textsubscript{BIAS} voltages. A separate V\textsubscript{BIAS} voltage allows pin 5 (V\textsubscript{BIAS}) to be used as an enable pin to power the device up and down during operation.

For both bias methods select the value of R\textsubscript{BIAS} to achieve the desired current based on the tables on page 4, and use DC blocks at pin 2 (RF\textsubscript{IN}) and pin 7 (RF\textsubscript{OUT} / V\textsubscript{DD}).

Biasing Option - V\textsubscript{DD} only
To use only V\textsubscript{DD}, connect pin 7 (RF\textsubscript{OUT} / V\textsubscript{DD}) to V\textsubscript{DD} through an RF choke inductor and connect pin 5 (V\textsubscript{BIAS}) to V\textsubscript{DD} through bias resistor R\textsubscript{BIAS} as shown in Figure 1.

Biasing Option - Separate V\textsubscript{DD} and V\textsubscript{BIAS} Voltages (V\textsubscript{BIAS} ≤ V\textsubscript{DD})
To use separate V\textsubscript{DD} and V\textsubscript{BIAS} voltages, connect pin 7 (RF\textsubscript{OUT} / V\textsubscript{DD}) to V\textsubscript{DD} through an RF choke inductor and connect pin 5 (V\textsubscript{BIAS}) to V\textsubscript{BIAS} through bias resistor R\textsubscript{BIAS} as shown in Figure 2. Typical current (I\textsubscript{BIAS}) draw for pin 5 (V\textsubscript{BIAS}) is 1.4 mA @ V\textsubscript{BIAS} = 3 V and 1 µA @ V\textsubscript{BIAS} = 0 V. Typical current (I\textsubscript{DD}) draw for pin 7 (RF\textsubscript{OUT} / V\textsubscript{DD}) is < 1 µA @ V\textsubscript{BIAS} = 0 V.
