

Features

- Wideband Performance
- Noise Figure: 4 dB @ 8 GHz
- Phase Noise: -154 dBc/Hz @ 1 kHz
- Bias Voltage: 5 V
- Bias Current: 60 mA
- 50 Ω Matched Input / Output
- Positive Voltage Only
- Die Size: 2.8 x 1.73 x 0.1 mm
- RoHS* Compliant

Description

The MAAL-011151-DIE is an easy to use, wideband low noise distributed amplifier die. It operates from 2 to 18 GHz and provides 17 dB of linear gain, 16 dBm of P1dB and 4 dB of noise figure at 8 GHz. The input and output are fully matched to 50 Ω with typical return loss >15 dB.

The RF input and RF output ports are DC blocked. Amplifier control is available through the use of a control circuit or by direct bias injection.

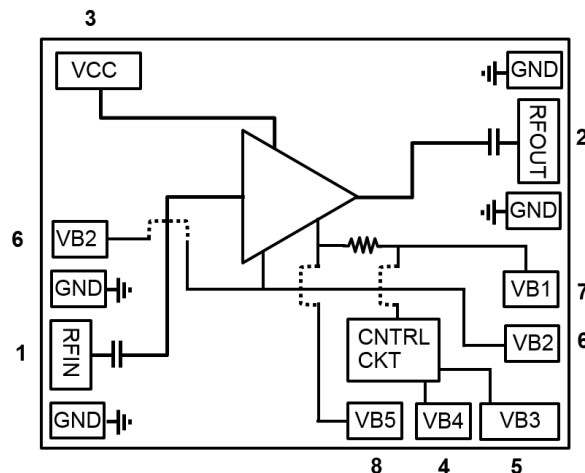

This product is fabricated using a low phase noise HBT process which features full passivation for enhanced reliability.

The MAAL-011151-DIE can be used as a low noise amplifier stage for signal generation applications. This device is ideally suited for Test and Measurement, EW, ECM, and Radar applications where ultra low phase noise and drive power is required.

7. Exceeding any one or combination of these limits may cause permanent damage to this device.
8. MACOM does not recommend sustained operation near these survivability limits.
9. Junction temperature directly effects device MTTF. Junction temperature should be kept as low as possible to maximize lifetime.

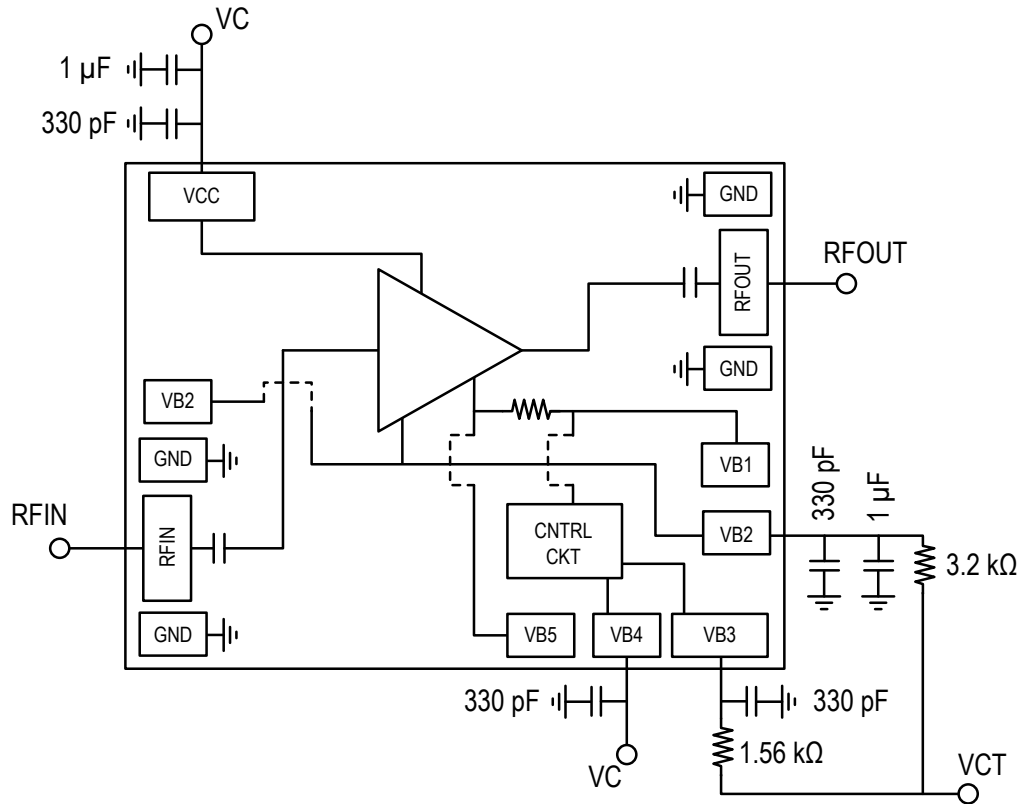

Handling Procedures

Please observe the following precautions to avoid damage:

Static Sensitivity

These electronic devices are sensitive to electrostatic discharge (ESD) and can be damaged by static electricity. Proper ESD control techniques should be used when handling these HBM Class 1A devices.

Application Schematic

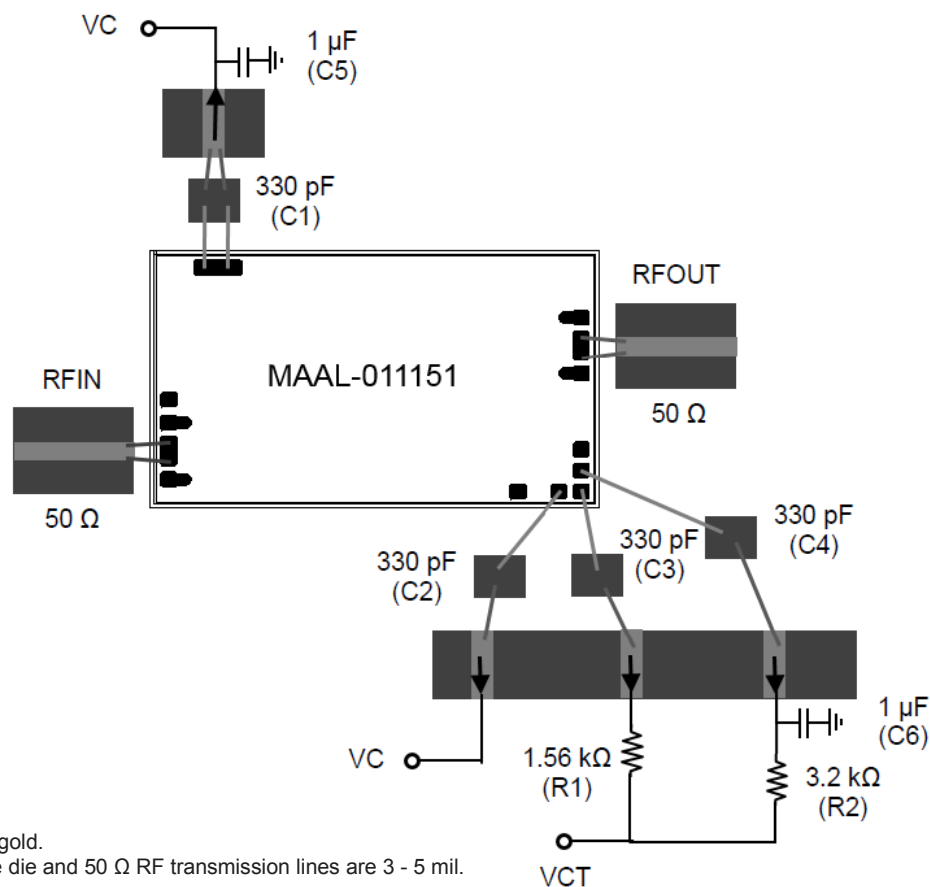

Operating Conditions

Recommended biasing conditions are VC = 5 V applied to the VB4 and VCC pads. Apply 5 V to the amplifier control VCT node through the offset resistors to VB2 and VB3 pads according to the application schematic as shown. Applying VCT = 5 V will turn the LNA on, which should draw 60 mA from VC. Applying VCT = 0 V will turn off the LNA. The VCT will draw <2 mA at 5 V. All DC supplies need to be low noise to prevent degradation of the amplifier phase noise.

Recommended Bonding Diagram & PCB Layout

RF input and output port matching circuit patterns are designed to compensate for bonding wires. Input and output bonding configuration are identical.

All wirebonds are 1 mil gold.
Separation between the die and 50 Ω RF transmission lines are 3 - 5 mil.
