MAAP-010168

10 W Power Amplifier
0.5 - 3 GHz

Features
- Saturated Output Power: 41 dBm
- Linear Gain: 24 dB
- Power Added Efficiency: 30% at $P_{\text{SAT}}$
- 50 Ω Input / Output Match
- Ceramic Flange Mount Package
- RoHS* Compliant and 260°C Re-flow Compatible

Description
The MAAP-010168 is a two stage MMIC power amplifier designed for broadband high power applications. It can be used as either a driver or an output stage amplifier. This device is fully matched input and output to 50 Ω which eliminates any sensitive external RF tuning components.

The device is packaged in a lead free 10-lead flanged hermetic package for high volume manufacturing.

The MAAP-010168 is fabricated using a fully passivated high reliability pHEMT process. The device provides excellent power added efficiency and gain.

2. Flange is DC and RF ground.
3. RF Input & RF Output ports have shunt DC paths to ground.
   No External DC voltage should be applied to the RF ports.

* Restrictions on Hazardous Substances, compliant to current RoHS EU directive.

4. Exceeding any one or combination of these limits may cause permanent damage to this device.
5. MACOM does not recommend sustained operation near these survivability limits.
6. Operating at nominal conditions with T_J ≤ +150°C will ensure MTTF > 1 x 10^6 hours.
7. Junction Temperature (T_J) = T_C + Θ_JC * ((V * I) - (P_OUT - P_IN))
   Typical thermal resistance (Θ_JC) = 2.0°C/W
   a) For T_C = 25°C @ 1.5 GHz
      T_J = +80°C @ +10 V, 4 A, P_OUT = 41 dBm, P_IN = 21 dBm
   b) For T_C = 85°C @ 1.5 GHz
      T_J = +138°C @ +10 V, 3.9 A, P_OUT = 41 dBm, P_IN = 21 dBm

Operating the MAAP-010168

The MAAP-010168 is static sensitive. Please handle with care. To operate the device, follow these steps.
Ramp down or shutdown in reverse order (gate bias on first and off last). All V_GG pins should have the same voltage applied at all times.
1. Apply V_GG (-1.5 V).
2. Apply V_DD (10.0 V Typical).
3. Set I_DQ by adjusting V_GG.
4. Apply RF_IN.

Handling Procedures

Please observe the following precautions to avoid damage:

Static Sensitivity

Gallium Arsenide Integrated Circuits are sensitive to electrostatic discharge (ESD) and can be damaged by static electricity. Proper ESD control techniques should be used when handling these devices.
Recommended Bias Configuration

GATE 1
GATE 2
DRAIN 1
DRAIN 2
RF IN
RF OUT

Cx = 1000 pF
Cy = 1 µF
Cz = 10 µF

Sample Board Layout
MAAP-010168 Recommended Layout

Below is the recommended layout for the MAAP-010168. For optimal stability MACOM recommends adding bias decoupling capacitors of 10 μF at the entry point of \(V_G\) and \(V_{DD}\) (At the DC connections Header PIN). It is also recommended to add shunt decoupling capacitors of 1 μF & 1000 pF at the gate and drain pins of MAAP-010168 as shown in the details A below.

MACOM can provide gerber files of the sample board layout upon request.

MAAP-010168 Sample Board Layout

0 50 100 150 200 250 300

8. Power dissipation should not exceed the maximum plot shown above to maintain $T_J < 150°C$. It is recommended to monitor power dissipation and decrease power dissipation in the device as required.

Ceramic Flange Mount Package†

This is a high frequency, low thermal resistance package. The package consists of a cofired ceramic construction with a copper-tungsten base and iron-nickel-cobalt leads. The finish consists of electrolytic gold over nickel plate.

† Reference Application Note M538 for lead-free solder reflow recommendations.
