Power Amplifier, 3 W
14.4 - 15.4 GHz

Features
- 24 dB Small Signal Gain
- 42 dBm Third Order Intercept Point (OIP3)
- >3 W Output P1dB
- Integrated Power Detector
- Bias 1200 mA @ 6 V
- Lead-Free 5 mm 24-lead QFN Package
- RoHS* Compliant and 260°C Reflow Compatible

Description
The MAAP-010517 is a packaged linear power amplifier that operates from 14.4 - 15.4 GHz. The device provides 24 dB gain and 42 dBm Output Third Order Intercept Point (OIP3) with 34.5 dBm output P1dB.

The packaged amplifier comes in an industry standard, fully molded 5 mm QFN package and is comprised of a three stage power amplifier with an integrated, temperature compensated on-chip power detector. The device includes on-chip ESD protection structures and DC by-pass capacitors to ease the implementation and volume assembly of the packaged part.

The device is specifically designed for use in 15 GHz point-to-point radios for cellular backhaul applications.

Ordering Information

<td>evaluation module</td>
</tr>
</tbody>
</table>

1. Reference Application Note M513 for reel size information.

2. Drain 3 Bias can be connected from either pins 11 or 20
3. The exposed pad centered on the package bottom must be connected to RF and DC ground.

Electrical Specifications:
Freq. = 14.4 - 15.4 GHz, I_{DQ} = 1200 mA, V_{DET} Bias = 5 V, V_D = 6 V, T_A = +25°C

4. It is recommended to use active bias on gate voltages to keep the drain currents constant in order to maintain the best performance over temperature.
5. Adjust V_G1, V_G2 and V_G3 between -1.2 and -0.1 V to achieve specified I_{DQ} (I_{DQ}=I_D1+I_D2+I_D3). V_G1, V_G2 and V_G3 should be the same voltage.
6. See page 3 for schematic on how to connect V_{DET} and V_{REF} pins.

7. Exceeding any one or combination of these limits may cause permanent damage to this device.
8. MACOM does not recommend sustained operation near these survivability limits.
9. Operating at nominal conditions with T_J ≤ 160°C will ensure MTTF > 1 x 10^6 hours.
10. Junction Temperature (T_J) = T_C + \Theta_{JC} * ((V * I) - (P_{OUT} - P_{IN}))
    Typical thermal resistance (\Theta_{JC}) = 7.9°C/W
    a) For T_C = +25°C,
       T_J = 88°C @ 6 V, 1.8 A, P_{OUT} = 34.5 dBm, P_{IN} = 11.5 dBm
    b) For T_C = +85°C,
       T_J = 143°C @ 6 V, 1.7 A, P_{OUT} = 34.5 dBm, P_{IN} = 11.5 dBm
11. Channel temperature directly affects a device’s MTTF. Channel temperature should be kept as low as possible to maximize lifetime.
12. For saturated performance it is recommended that the sum of (2*V_{DDG} + abs(V_{DDG})) <14 V.

Handling Procedures

Please observe the following precautions to avoid damage:

Static Sensitivity

Gallium Arsenide Integrated Circuits are sensitive to electrostatic discharge (ESD) and can be damaged by static electricity. Proper ESD control techniques should be used when handling these Class 1A devices.
