GaN Bias Controller/Sequencer Module
Dual Supply: -8 to -3 V, +5 V

Features
- Robust GaN Protection at Any Power Up/Power Down Sequence
- Fixed Gate with Pulsed Drain Bias Voltage. Add-On Module Allows for Gate Pulsing
- Open Drain Output Current of ≤200 mA for External MOSFET Switch Drive
- 30 dB EMI/RFI Rejection at All I/O Ports
- 6.60 x 22.48 mm² Package with 1 mm Pitch SMT Leads
- Target ≤500 ns Total Switch Transition Time
- Low Power Dissipation <100 mW
- Gate Bias Output Current ≤50 mA for Heavy RF Compression
- RoHS* Compliant and 260°C Reflow Compatible

Description
The MABC-001000-DPS00L is a Low Power Dissipation bias controller that provides proper gate voltage and pulsed drain voltage biasing for a device under test (DUT). Applicable DUT’s include depletion-mode GaN (Gallium Nitride) or GaAs (Gallium Arsenide) power amplifiers or HEMT devices.

The module also provides bias sequencing so that pulsed drain voltage cannot be applied to a DUT unless the negative gate bias voltage is present.

The applications section of this datasheet will show how the module can be implemented for the following two applications:

- Application Option 1: Fixed negative gate biasing with pulsed drain biasing.
- Application Option 2: Pulsed negative gate biasing with pulsed drain biasing.

Both of these application options will recommend the external circuitry and p-Channel Power MOSFET.

The MABC-001000-DP000L module can also be installed onto an MABC-001000-PB2PPR evaluation board for evaluation, test, and characterization purposes.

6. Propagation delay is measured from 90% of the TTL signal to 10% of the signal of interest.
7. Rise and fall times are measured between 10% and 90% of the steady state signal.

Applications Section

Functional Description
The MABC-001000-DPS00L GaN Bias Controller/Sequencer Module circuitry provides proper sequencing and generation of the gate voltage and pulsed drain voltage for a device under test (DUT). Reference the Product View and Pin Configuration table on page 1. The basic functions of the circuits within the module are described as follows:

- Overhead Voltages for the Circuits within the MABC-001000-DPS00L Module
  - Pin 11 (P4V) is the +5V Vcc Input that supplies the positive voltage for the circuits within the module.
  - Pin 5 (VGS) is the Gate (-) Supply Voltage that is also used to supply the negative voltage for the circuits within the module.

- Negative Gate Voltage for the Device Under Test (DUT)
  - A voltage follower op-amp circuit provides a low impedance output to Pin 3 (GCO) Gate Voltage (-) Control Output. Pin 3 (GCO) output is connected to the gate terminal of a DUT as shown in Figure 1 on page 5.
  - The reference voltage for the voltage follower is provided by the Pin 4 (GCI) Gate Voltage (-) Analog Input. This input reference voltage is developed by an external potentiometer/ resistive divider circuit as shown in Figure 1 on page 5. It is recommended to use the -8 V to -3 V voltage that is also applied to Pin 5 (VGS).
  - Reference: The external potentiometer is adjusted to set the gate voltage Pin 3 (GCO) to the DUT. Alternative voltage inputs such as a temperature compensation circuit or a Digital-to-Analog (DAC) converter could also be supplied to Pin 4 (GCI).

- Pin 9 (SWG) MOS Switch Driver Output
  - An N-Channel MOSFET develops the pulsed signal (SWG) to drive the resistive divider network for the gate of an external p-Channel HEXFET as shown in Figure 1 on page 5. The input signal for the internal MOSFET is provided by the output from the sequencing circuits.

- Sequencing Circuits
  - A voltage comparator circuit senses if the negative gate voltage is present as an input on Pin 1 (GFB) - Gate Voltage (-) Feedback.
  - A logic circuit provides the switched input enable signal for the N-Channel MOSFET. The following 3 signals must be at correct levels to generate the enable logic signal:
    - Pin 12 (ENS) MOS Switch Enable TTL
    - Negative gate voltage (GFB) is present
    - P4V voltage is present.
Applications Section

Module Layout Guidelines

Reference the Product View, Pin Configuration Table on page 1, and the Recommended Landing Pattern on page 7.

The following recommendations should be followed when the MABC-001000-DPS00L module is used to bias a high-power RF device or amplifier. The input and output locations were determined so that the layout and signal routing could be optimized when interfacing with a high-power amplifier assembly.

- The negative gate voltage input and outputs are located on the left side of the module and should be located as close as possible to the gate bias pads on the high-power amplifier assembly.

- The positive pulsed voltages are located on the right side of the module and should be located as close as possible to the external MOSFET switch. The MOSFET switch drain should be located as close as possible to the drain bias pads on the high-power amplifier assembly. The charge storage capacitors should be located as close as possible to the MOSFET switch source terminal pads.

- The module ground pads are located at Pins 7, 13, and 14.

- Route all signal lines and ground returns to be as short as possible and implement a ground plane on the back of the printed wiring board (PWB) if that option is available to the designer. Following these layout criteria will minimize circuit parasitics that degrade the performance of the pulsed signal.

Application Option 1: Fixed Gate with Pulsed Drain Biasing

Figure 1 shows a block diagram of the MABC-001000-DPS00L module with the recommended external components to support this application option. See Table 1 for component recommendations and values.

Application Option 2: Pulsed Gate and Pulsed Drain Biasing

A block diagram showing a typical application of the MABC-001000-PB2PPR sample board is shown in Figure 2 below. Figures 3 and 4 show layouts of the MABC-001000-PB2PPR sample board with/without the MABC-001000-DPS00L module installed.

The additional external circuitry on the MABC-001000-PB2PPR sample board provides the added capability of pulsed gate biasing. It is important to note that the evaluation boards can be configured for either Option 1 or 2. A Full schematic, assembly layout, and Bill of Materials are available upon request.

Handling Procedures
Please observe the following precautions to avoid damage:

Static Sensitivity
This module is sensitive to electrostatic discharge (ESD) and can be damaged by static electricity. Proper ESD control techniques should be used when handling these HBM class 1B devices.
