

Features

- Low Series Resistance
- Low Capacitance
- High Cutoff Frequency
- Silicon Nitride Passivation
- Polyimide Scratch Protection
- Designed for Easy Circuit Insertion

Applications

- Radar
- Communications
- Test and Measurement

Description

The MADZ-011002 Single junction, MADZ-011003 anti-parallel pair, MADZ-011004 reverse tee and MADZ-011005 unconnected anti-parallel pair are gallium arsenide flip chip THz Schottky barrier diodes.

These devices are fabricated on OMCVD epitaxial wafers using a process designed for high device uniformity and extremely low parasitics. The diodes are fully passivated with silicon nitride and have an additional layer of polyimide for scratch protection. The protective coatings prevent damage to the junction during automated or manual handling. The flip chip configuration is suitable for pick and place insertion.

The high cutoff frequencies of these diodes allow use through G and W band frequencies. Typical applications include single and double balanced mixers in radio transceivers and automotive radars.

The MADZ-011003 anti-parallel pair is designed for use in sub harmonically pumped mixers. Close matching of the diode characteristics results in high LO suppression at the RF input.

The MADZ-011005 unconnected pair may be used in temperature-compensated detector circuits, as well as receiver protector limiter circuits and more.

1. Total capacitance is equivalent to the sum of junction capacitance and parasitic capacitance.
2. Slope resistance is determined by measuring the dynamic resistance and subtracting the junction resistance of 2.6 Ω.
3. Capacitance for the MADZ-011003, MADZ-011004 and MADZ-011005 is specified for each Schottky diode junction.

Absolute Maximum Ratings^{5,6}

Parameter	Absolute Maximum
LO & RF Incident Power	20 dBm
Mounting Temperature	+235°C for 10 seconds
Operating Temperature	-65°C to +125°C
Storage Temperature	-65°C to +150°C

- Exceeding any one or combination of these limits may cause permanent damage to this device.
- MACOM does not recommend sustained operation near these survivability limits.

Handling Procedures

Please observe the following precautions to avoid damage:

Static Sensitivity

These electronic devices are sensitive to electrostatic discharge (ESD) and can be damaged by static electricity. Proper ESD control techniques should be used when handling these Human Body Model (HBM) Class 0 devices.

Cleanliness:

The chips should be handled in a clean environment. Do not attempt to clean die after installation.

Static Sensitivity:

Schottky barrier diodes are ESD sensitive and can be damaged by static electricity. Proper ESD techniques should be used when handling these devices.

General Handling:

The protective polymer coating on the active areas of these die provides scratch protection, particularly for the metal air bridge which contacts the anode. Die can be handled with tweezers or vacuum pickups and are suitable for use with auto-

Forward Current vs. Temperature

Mounting Techniques

This device is designed to be inserted onto hard or soft substrates with the junction side down. It can be mounted with conductive epoxy or with a low temperature solder preform.

Solder Die Attach:

Solder which does not scavenge gold, such as Indalloy #2, is recommended. Sn-Pb based solders are not recommended due to solder embrittlement. Do not expose die to a temperature >235°C, or >200°C for longer than 10 seconds. No more than 3 seconds of scrubbing should be required for attachment.

Epoxy Die Attach:

Assembly can be preheated to 125 - 150°C. Use a minimum amount of epoxy. Cure epoxy as per manufacturer's schedule. For extended cure times, temperatures should be kept below 200°C.

Typical Performance @ +25 °C, $Z_0 = 50 \Omega$
