MAGX-011086

GaN on Silicon General Purpose Amplifier
DC - 6 GHz, 28 V, 4 W

Features
- GaN on Si HEMT D-Mode Amplifier
- Suitable for Linear & Saturated Applications
- Tunable from DC - 6 GHz
- 28 V Operation
- 9 dB Gain @ 5.8 GHz
- 45% Drain Efficiency @ 5.8 GHz
- 100% RF Tested
- Thermally-Enhanced 4 mm 24-Lead QFN
- RoHS* Compliant

Description
The MAGX-011086 is a GaN on silicon HEMT amplifier optimized for DC - 6 GHz operation in a user friendly package ideal for high bandwidth applications. The device has been designed for saturated and linear operation with output power levels of 4 W (36 dBm) in an industry standard, low inductance, surface mount QFN package. The pads of the package form a coplanar launch that naturally absorbs lead parasitics and features a small PCB outline for space constrained applications.

The MAGX-011086 is ideally suited for Wireless LAN, High Dynamic Range LNA’s, broadband general purpose, land mobile radio, defense communications, wireless infrastructure, and ISM applications.

Built using the SIGANTIC® process - a proprietary GaN-on-Silicon technology.

<td>-40°C to +85°C</td>
</tr>
<tr>
<td>Storage Temperature</td>
<td>-65°C to +150°C</td>
</tr>
</tbody>
</table>

4. Exceeding any one or combination of these limits may cause permanent damage to this device.
5. MACOM does not recommend sustained operation near these survivability limits.
6. Operating at nominal conditions with \(T_J \leq 200°C\) will ensure \(MTTF > 1 \times 10^6\) hours.

## Thermal Characteristics\(^7,8\)

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Test Conditions</th>
<th>Symbol</th>
<th>Typ.</th>
<th>Units</th>
</tr>
</thead>
<tbody>
<tr>
<td>Thermal Resistance</td>
<td>(V_{DS} = 28) V, (T_J = 200°C)</td>
<td>(\Theta_{JC})</td>
<td>12.5</td>
<td>°C/W</td>
</tr>
</tbody>
</table>

8. The thermal resistance of the mounting configuration must be added to the device \(\Theta_{JC}\), for proper \(T_J\) calculation during operation. The recommended via pattern, shown on page 6, on a 20 mil thick, 1 oz. plated copper, PCB contributes an additional 6.6°C/W to the typical value.

## Handling Procedures

Please observe the following precautions to avoid damage:

### Static Sensitivity

Gallium Nitride Integrated Circuits are sensitive to electrostatic discharge (ESD) and can be damaged by static electricity. Proper ESD control techniques should be used when handling these class 1A devices.

Evaluation Board and Recommended Tuning Solution
5.8 GHz Narrowband Circuit

Description
Parts measured on evaluation board (20-mil thick RO4350). The PCB’s electrical and thermal ground is provided using a standard-plated densely packed via hole array (see recommended via pattern).

Matching is provided using a combination of lumped elements and transmission lines as shown in the simplified schematic above. Recommended tuning solution component placement, transmission lines, and details are shown on the next page.

Bias Sequencing
Turning the device ON
1. Set $V_{GS}$ beyond pinch-off ($V_p$), typically -5 V.
2. Turn on $V_{DS}$ to nominal voltage (28 V).
3. Increase $V_{GS}$ until the $I_{DS}$ current is reached.
4. Apply RF power to desired level.

Turning the device OFF
1. Turn the RF power off.
2. Decrease $V_{GS}$ down to $V_p$.
3. Decrease $V_{DS}$ down to 0 V.
4. Turn off $V_{GS}$.
