Description

M/A-COM's MAIA-007495-000100 is an integrated assembly containing a GaAs FET MMIC LNA and GaAs FET mixer. This device is packaged in a 16 leaded QSOP plastic surface mount package. The amplifier can be biased with either +3V or +5V, the mixer requires no DC bias. The conversion gain of the integrated combination is typically 6 dB at +3V bias and 8 dB at +5V bias. The SA65-0003 is ideally suited for RF/IF communications applications requiring down conversion with some gain.

This MCM contains a mixer that is fabricated using a mature 1-micron GaAs process, it also contains an LNA that is fabricated using a low cost mature 0.5-micron gate length GaAs MESFET process. Both die feature full passivation for increased performance and reliability.

3. For IP₃ measurements, RFIN = -24 dBm, this low RF IN level gets amplified through the LNA.
4. For IP₃ measurements, RFIN2 = RFIN1 + 10 MHz, LO = RFIN1—140 MHz.
5. For IP₃ measurements, IP₃ = IMR/2 + PIN.
6. RF IN to IF Isolation is typically 0 dB.
7. Reverse Isolation is measured from IF to RFIN with the IF at -10 dBm, LO at +13 dBm.
8. The amplifier has a normal gain of 12.5 dB, 3V bias and 14.0 dB, 5V bias. Amplifier typical Noise Figure = 1.5 dB.
9. $N_{\text{T}} = N_{\text{F}_1} + (N_{\text{F}_2} - 1)/G_1$

10. Exceeding any one or combination of these limits may cause permanent damage to this device.
11. M/A-COM does not recommend sustained operation near these survivability limits.

Handling Procedures

Please observe the following precautions to avoid damage:

Static Sensitivity

Gallium Arsenide Integrated Circuits are sensitive to electrostatic discharge (ESD) and can be damaged by static electricity. Proper ESD control techniques should be used when handling these devices.

15. All external circuitry parts are readily available, low cost surface mount components (.060 in. x .030 in. or .080 in. x .050 in.).
16. Pin 2 allows use of an external resistor to ground for optional higher current. For 20 mA operation, no resistor is used.
- For $I_{DD} \approx 30$ mA, R2 = 43 Ohms
For $I_{DD} \approx 45$ mA, R2 = 15 Ohms
For $I_{DD} \approx 60$ mA, R2 = 10 Ohms

The spurious table shows the spurious signals resulting from the mixing of the RFIN and LO input signals, assuming down conversion. The number of dB below the conversion loss level indicates the mixing products. The lower frequency mixing term is shown for two different input levels. The top number is for an RFIN power level of -19 dB; the lower number is for -29 dB. Assuming the LNA gain is approximately 14 dB, the mixer input will see approximately -5 dB and -15 dB.

$$|mF_{RF} - nF_{LO}|, RF = -19 \text{ dB}$$

$$|mF_{RF} - nF_{LO}|, RF = -29 \text{ dB}$$

$$RF = 1850 \text{ MHz}$$

$$LO = 1710 \text{ MHz}$$
