Description

The MASW-011071 is a terminated silicon PIN diode SPDT switch designed for X-Band high power, high performance applications. The switch is assembled in a lead-free 7 mm 44-lead PQFN plastic package and handles greater than 20 W of CW power over the 8.0 - 10.5 GHz frequency band.

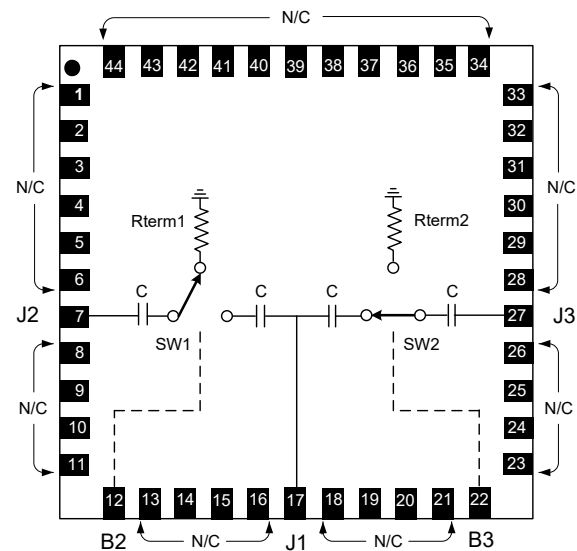

The device is fabricated using MACOM's patented HMIC process, which allows for the integration of silicon pedestals that embed series and shunt diodes in low loss, low dispersion glass. The switch offers 1 dB insertion loss as well as 38 dB isolation performance. The device integrates a bias network to allow for simplified bias application and switch control.

6. Typical switching speed measured from 10% to 90 % of detected RF signal driven by TTL compatible drivers. MACOM recommends the MADR-011020, Complementary Channel TTL PIN Diode Driver.

Bias Control⁷

Optimal operation is achieved by simultaneous application of negative DC voltage to the low loss switch path and positive DC voltage to the isolating switch path.

In the low loss path, the diodes are reverse biased. In the isolating path, the diodes are forward biased.

Minimum Reverse Bias Required:

At X-Band, with a 1:1 match, 5 V of reverse bias is required. With a 4:1 match, 10 V of reverse bias is required.

However MACOM recommends 30 V of reverse bias to achieve optimal operating conditions.

Handling Procedures

Please observe the following precautions to avoid damage:

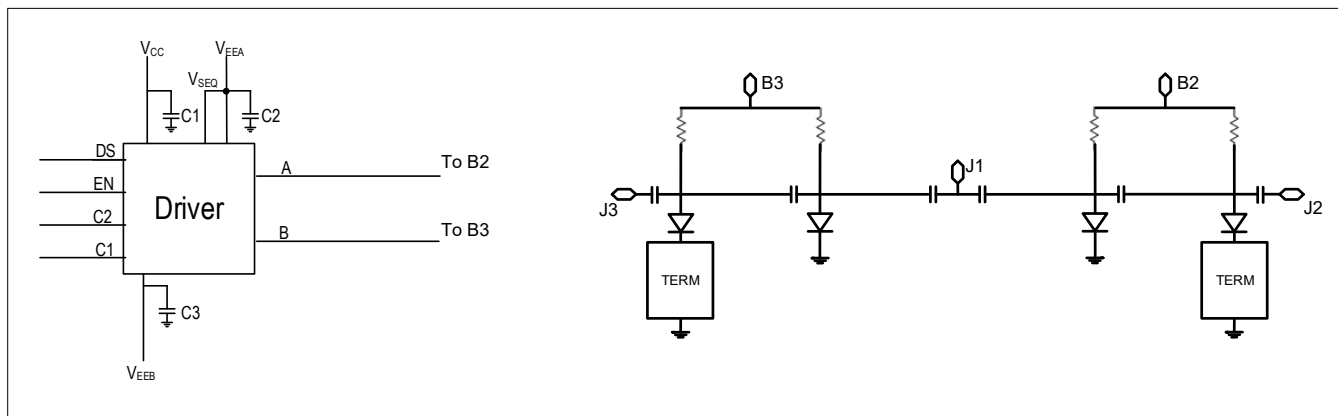

Static Sensitivity

Integrated Circuits are sensitive to electrostatic discharge (ESD) and can be damaged by static electricity. Proper ESD control techniques should be used when handling these HBM Class 1A devices.
