**Features**
- GaN on Si HEMT D-Mode Amplifier
- Suitable for Linear & Saturated Applications
- Broadband Operation from 20 - 1500 MHz
- 28 V Operation
- 16 dB Gain @ 1 GHz
- 42% PAE @ 1 GHz
- 100% RF Tested
- 50 Ω Input / Output Matched
- Lead-Free 4 mm 16-lead QFN plastic Package
- RoHS* Compliant and 260°C Reflow Compatible

**Description**
The NPA1003QA is a GaN on silicon power amplifier optimized for 20 - 1500 MHz operation. This amplifier has been designed for saturated and linear operation with output levels to 5 W (37 dBm) assembled in a lead-free 4 mm 16-lead QFN plastic package.

The NPA1003QA is ideally suited for broadband general purpose, test and measurement, defense communications, land mobile radio and wireless infrastructure.

1. All no connection pins may be left floating or grounded.
2. The exposed pad centered on the package bottom must be connected to RF and DC ground. This path must also provide a low thermal resistance heat path.

* Restrictions on Hazardous Substances, compliant to current RoHS EU directive.

</tbody>
</table>

3. Exceeding any one or combination of these limits may cause permanent damage to this device.
4. MACOM does not recommend sustained operation near these survivability limits.
5. Operating at nominal conditions with \(T_J \leq 180°C\) will ensure \(MTTF > 1 \times 10^6\) hours.

Handling Procedures
Please observe the following precautions to avoid damage:

Static Sensitivity
Gallium Nitride Circuits are sensitive to electrostatic discharge (ESD) and can be damaged by static electricity. Proper ESD control techniques should be used when handling these HBM Class 1A devices.
Evaluation Board and Recommended Tuning Solution
20 - 1500 MHz Broadband Circuit

Description
Parts measured on evaluation board (20-mil thick RO4350). The PCB’s electrical and thermal ground is provided using a standard-plated densely packed via hole array (see recommended via pattern).

Matching is provided using a combination of lumped elements and transmission lines as shown in the simplified schematic above. Recommended tuning solution component placement, transmission lines, and details are shown on the next page.

Bias Sequencing
Turning the device ON
1. Set $V_{GS}$ to the pinch-off ($V_{P}$), typically -5 V.
2. Turn on $V_{DS}$ to nominal voltage (28 V).
3. Increase $V_{GS}$ until the $I_{DS}$ current is reached.
4. Apply RF power to desired level.

Turning the device OFF
1. Turn the RF power off.
2. Decrease $V_{GS}$ down to $V_{P}$.
3. Decrease $V_{DS}$ down to 0 V.

Recommended Via Pattern (All dimensions shown as inches)
