NPT2020

GaN on Silicon General Purpose Amplifier
DC - 3.5 GHz, 48 V, 50 W

Features
- GaN on Si HEMT Depletion Mode Amplifier
- Suitable for Linear & Saturated Applications
- Tunable from DC - 3.5 GHz
- 48 V Operation
- 13.5 dB Gain @ 3.5 GHz
- 55% Drain Efficiency @ 3.5 GHz
- 100% RF Tested
- Standard Package with Bolt Down Flange
- RoHS* Compliant and 260°C Reflow Compatible

Description
The NPT2020 is a GaN on silicon HEMT general purpose amplifier optimized for DC - 3.5 GHz operation. This device supports CW, pulsed, and linear operation with output power levels to 50 W (47 dBm) in an industry standard surface mount package.

The NPT2020 is ideally suited for defense communications, land mobile radio, avionics, wireless infrastructure, ISM applications and VHF/UHF/L/S-band radar.

Built using the SIGANTIC® process - a proprietary GaN-on-Silicon technology.

Ordering Information

3. Exceeding any one or combination of these limits may cause permanent damage to this device.
4. MACOM does not recommend sustained operation near these survivability limits.
5. Operating at nominal conditions with $T_J \leq 200°C$ will ensure $MTTF > 1 \times 10^6$ hours.

Handling Procedures
Please observe the following precautions to avoid damage:

Static Sensitivity
Gallium Nitride Circuits are sensitive to electrostatic discharge (ESD) and can be damaged by static electricity. Proper ESD control techniques should be used when handling these HBM Class 1A devices.
Load-Pull Performance: V_{DS} = 48 V, I_{DQ} = 350 mA, T_{C} = 25 °C

Evaluation Board and Recommended Tuning Solution

3.5 GHz Narrowband Circuit

**Description**
Parts measured on evaluation board (20-mil thick RO4350). Matching is provided using a combination of lumped elements and transmission lines as shown in the simplified schematic above. Recommended tuning solution component placement, transmission lines, and details are shown on the next page.

**Bias Sequencing**

**Turning the device ON**
1. Set $V_{GS}$ to the pinch-off ($V_P$), typically -5 V.
2. Turn on $V_{DS}$ to nominal voltage (48 V).
3. Increase $V_{GS}$ until the $I_{DS}$ current is reached.
4. Apply RF power to desired level.

**Turning the device OFF**
1. Turn the RF power off.
2. Decrease $V_{GS}$ down to $V_P$.
3. Decrease $V_{DS}$ down to 0 V.
4. Turn off $V_{GS}$.
