

Features

- MoCA Compliant Front-End GaAs IC
- Linear Power Amplifier
- Integrated PA Bias Control
- PA Power Down Mode
- Transmit/Receive Switch
- Transmit Power Detector
- 0/3 dB Transmit Attenuator
- 0/15 dB Receive Attenuator
- 3.3 Volt Single Bias
- Integrated Digital Control Logic
- Compatible with EN2512 & EN2552
- Lead-free 3 mm 16-lead PQFN Package
- RoHS* Compliant
- 50 Ω Characteristic Impedance

Description

The XZ1004-QT is an integrated front end GaAs IC for MoCA mid-band RF applications which is fully compatible with Entropic Communications chipset. It is housed in an industry standard 3 mm PQFN package and operates from a single 3.3 V bias. The chip includes a power amplifier, transmit/receive switch, power detector, switched attenuators, bias circuits and digital control circuitry. The transmit path includes a 3 dB switched attenuator and power detector for gain adjustment and linearity optimization. A switched attenuator in the receiver provides a 15 dB gain step. The integrated bias circuit stabilizes transmit amplifier performance over temperature and process variation with power down functionality and optional bias adjustment. The device typically delivers 20 dBm at P1dB and +34 dBm OIP3 across the operating temperature range. The digital inputs control all circuit operating modes and are compatible with Entropic's MoCA chipsets.

Pin Description

Pin No.	Pin Name	Function
1	RX_ATT	Digital input. A logic high input voltage enables the 15 dB receive attenuator.
2	TX_RX	Digital input. A logic high voltage selects transmit mode, logic low selects receive mode.
3	CAL	Digital input. A logic high selects calibration mode (transmit amplifier output is diverted into the power detector). This pin overrides the TX_RX control input.
4	TX_IN	Transmit RF input (50 Ω).
5	TX_ATT	Digital input. A logic low input voltage enables the 3 dB transmit attenuator.
6	PWR_DWN	Digital input. A logic low input voltage reduces the I _{D1} current.
7	VD2	Bias supply.
8	BIAS_ADJ	Bias adjustment of transmit amplifier using pull-up/down resistor (normally connected to V _{DD}).
9	VD1	Amplifier bias supply.
10	L_OP	External inductor connected to this pin sets the transmit return loss and linearity levels.
11	I_O	RF input in the receive mode and RF output in the transmit mode (50 Ω).
12	DET_ATT	External RC network connected to this pin sets the power detector sensitivity.
13	VD3	Detector bias supply.
14	VDET	Power detector output voltage. Used during calibration mode to measure output power.
15	RX_OUT	Receive RF output (50 Ω).
16	RX_ADJ	External RC network connected to this pin sets the receive attenuator gain step.

Handling Procedures

Please observe the following precautions to avoid damage:

Static Sensitivity

Gallium Arsenide Integrated Circuits are sensitive to electrostatic discharge (ESD) and can be damaged by static electricity. Proper ESD control techniques should be used when handling these devices.

Lead-Free 3 mm 16-Lead PQFN[†]

[†] Reference Application Note S2083 for lead-free solder reflow recommendations and PCB footprint information.
Meets JEDEC moisture sensitivity level 1 requirements.
Plating is 100% matte tin over copper.
