1.3 Terminal Fatigue Testing:

SGS Report Reference: SZRL06006D

1.3.1 Test Purpose:
This test is designed to check the capabilities of the device solder pads to withstand a delamination (peel) stress of specified tension and time.

1.3.2 Test Method/Specification:
Refer to Mil-STD-883G Method 2004.5 condition D.
Test Condition:
- A minimum tension of 8 ounces (2.22 N) shall be applied, without shock, to each solder pad to be tested in a direction perpendicular to the solder pad surface and maintained for 30 seconds minimum.

Test Profile:

![Figure 1.3A - Solder pad adhesion](image)

1.3.3 Appearance Inspection:
Appearance inspection performed before and after test.

1.3.4 Sample(s) Inspection before Test:
Sample(s) Description: MABA-008980-CF0440
Quantity: 5 PCS (3#~7#)
Appearance Inspection: No visual damage was found on samples before test. See Photo 1.3C.

1.3.5 Test Procedure:

Test Equipment:

**Name:** Testometric

**Model:** CMT6503

**Equipment No.** 10611042

Lab Environmental Conditions: Ambient temperature: 25±3°C, Relative humidity: 55±20%RH.

1.3.6 Test Result(s):
Standard's failure criteria:When examined, using 10X magnification, after removal of the tension stress, the appearance of any delamination involving constituent solder pad interfaces shall be considered an adhesion failure of the solder pad. Separation of the solder pad from the device is an obvious (without visual magnification) adhesion failure. Separation of the wire from the solder fillet (leaving the solder pad intact) or wire breakage is considered a test procedure failure.
